

Amendments to the Claims:

1. (Currently Amended) A method of generating a ring back tone, the method comprising:

receiving by a first terminal a request for a call setup generated by a second terminal, wherein the first terminal communicates over a voice over internet protocol (VOIP) network and the second terminal communicates over public switched telephone network (PSTN), wherein the VOIP and the PSTN networks are connected by way of a trunk gateway;

identifying a type of a network to which the second terminal requesting the call setup belongs;

generating ring back tone data independently by the first terminal, if the type of the network is a public switched telephone network;

storing the generated ring back tone data in a buffer;

inserting the ring back tone data into a response ~~message sent from the first terminal to the second terminal in response to the call setup request after reading out the ring back tone from the buffer;~~ and

transmitting the response message from the first terminal to the second terminal in response to the call setup.

wherein the ring back tone is inserted into the response message according to a first-in first-out method.

wherein the response message is transmitted to the port informed by the trunk gateway during the call setup.

wherein the second terminal receives the response message and generates a ring back tone according to the ring back tone data included by the first terminal into the response message.

2. (Original) The method of claim 1, wherein the response message comprises at least one data packet communicated based on real-time transport protocol.

3. (Canceled)

4. (Original) The method of claim 1, wherein the type of the network is identified based on a specific message transmitted from the network.

5. (Original) The method of claim 1, wherein the type of the network is identified based on a number of the second terminal.

6. (Original) The method of claim 5, wherein the type of the network is identified based on a prefix included in the number of the second terminal.

7. (Original) The method of claim 4, wherein the specific message informs that the network has no function for generating the ring back tone data.

8. (Original) The method of claim 1, wherein if the type of the network is a public switched telephone network, the first terminal generates the ring back tone data.

9. (Currently Amended) A first terminal configured for communicating over a voice over internet protocol (VOIP), the first terminal comprising:

a decision section for deciding whether to generate ring back tone data after identifying a type of a network to which a second terminal requesting a call setup belongs; [[and]]

a memory for storing the ring back tone data; and

a signal processor for independently generating the ring back tone data to be transmitted to the second terminal according to the type of the network, [[and]] inserting the ring back tone data into a response message to the call setup and transmitting the response message to the second terminal,

wherein the first terminal communicates over a voice over internet protocol (VOIP) network and the second terminal communicates over public switched telephone network (PSTN),

wherein the VOIP and the PSTN networks are connected by way of a trunk gateway,

wherein the second terminal receives the response message and generates a ring back tone according to the ring back tone data included by the first terminal into the response message,

wherein the signal processor reads the stored ring back tone data according to a first-in first-out method so as to insert the ring back tone data in the response message.

10. (Original) The first terminal of claim 9, wherein the response message comprises at least one data packet based on real-time transport protocol.

11. (Original) The first terminal of claim 9, wherein if the type of the network is a public switched telephone network, the signal processor generates the ring back tone data.

12. (Canceled)

13. (Original) The terminal of claim 9, wherein the type of the network is identified based on a specific message transmitted from the network.

14. (Original) The terminal of claim 9, wherein the type of the network is identified based on a number of the second terminal.

15. (Original) The terminal of claim 14, wherein the type of the network is identified based on a prefix among the number of the second terminal.

16. (Original) The terminal of claim 13, wherein the specific message informs that the network has no function of generating the ring back tone data.

17-21 (Canceled)
